OpenCode Setup and Guide

OpenCode Setup

This is the full documentation on how to setup OpenCode AI in your project.

What is OpenCode?

A free, open-source AI coding agent that runs in your terminal, VS Code, or in desktop app, similar to Claude Code, ChatGPT Codex, Cursor, Windsurf, and Google Antigravity.

Official Website: https://opencode.ai/
GitHub: https://github.com/anomalyco/opencode/tree/v2

OpenCode Installation

This is the instructions for installing OpenCode AI in your project folder.

Step 1: Create `.opencode` folder

Create `.opencode\` folder in the root folder of your project.

Step 2: Create `command` and `skills` folder

In `.opencode` folder, create `command\` and `skills\` folder.

Step 3: Create `AGENTS.md` file

In your root project folder, create the `AGENTS.md` file, this file will serve as the foundation or the principal rule for all AI models that you are using. In this file, you set rules that apply globally at any AI tools (e.g., ChatGPT Codex, Gemini, Claude, DeepSeek, etc.).

Step 4: Initiate OpenCode in your project

In VS Code, proceed to `.opencode` folder and execute this command to get started:

```
C:User/project> cd .opencode
C:User/project> npm i -g opencode-ai@latest
```

Skills & Commands

Skills: A reusable package of instructions, rules, and files that teaches an AI how to do a specific, recurring task.

Commands: (often typed as a slash command like `/analyze` or `/debug`) is a short trigger word you type to make the AI run that skill or action immediately.

OpenCode Hacks

Instead prompting directly on the OpenCode CLI, you can create a markdown file of your prompt instead, then let the AI read your saved prompt. This is a standard practice in organizing prompts and project management.

1. Create a `<your-prompt-name>.md` in the `/docs` folder.
2. Write all of the instructions in your prompt file (e.g., `my-tech-stack.md`).
3. Mention the context file (the instructions you create) that you wanted to reference and let OpenCode read and analyze it.
